Report

- Main objective of the analysis that also specifies whether your model will be focused on a specific type of Deep Learning or Reinforcement Learning algorithm and the benefits that your analysis brings to the business or stakeholders of this data.
- Brief description of the data set you chose, a summary of its attributes, and an outline of what you are trying to accomplish with this analysis.
- Brief summary of data exploration and actions taken for data cleaning or feature engineering.
- Summary of training at least three variations of the Deep Learning model you selected. For example, you can use different clustering techniques or different hyperparameters.
- A paragraph explaining which of your Deep Learning models you recommend as a final model that best fits your needs in terms of accuracy or explainability.
- Summary Key Findings and Insights, which walks your reader through the main findings of your modeling exercise.
- Suggestions for next steps in analyzing this data, which may include suggesting revisiting this model or adding specific data features to achieve a better model.

You can run my notebook on Kaggle. GPU recommended:

https://www.kaggle.com/konutech/cifar100-image-classification-to-1-of-100-classes

1. Main objective of the analysis that also specifies whether your model will be focused on a specific type of Deep Learning or Reinforcement Learning algorithm and the benefits that your analysis brings to the business or stakeholders of this data.

The main objective of the analysis was to classify images with highest possible accuracy. Here, in my project images could have been classified by 100 classes, e.g. "mountain", "road". Due to characteristics of the challenge I have used few variations of Convolutional Neural Networks (or CNN).

Simplest benefit from implementation of image classification automation for a business area might be a case when a user is expected to upload a particular picture but instead he uses a random one. Let's imagine that insurence company expects to upload an image of a car but receives a picture of a horse.

2. Brief description of the data set you chose, a summary of its attributes, and an outline of what you are trying to accomplish with this analysis.

The data I used comes from https://www.cs.toronto.edu/~kriz/cifar.html

In contrary to the data set used during the course which was grouped by 10 classes, and for the sake of studying deep learning methods, I decided to increase the challenge of classification to 100 groups.

The dimensions of training set are (50000, 32, 32, 3) so in other words:

- the model was trained using 50.000 classified images
- the images are in RBS scale and each one has 32*32 pixels

Test set consists of 10.000 images.

The labels are:

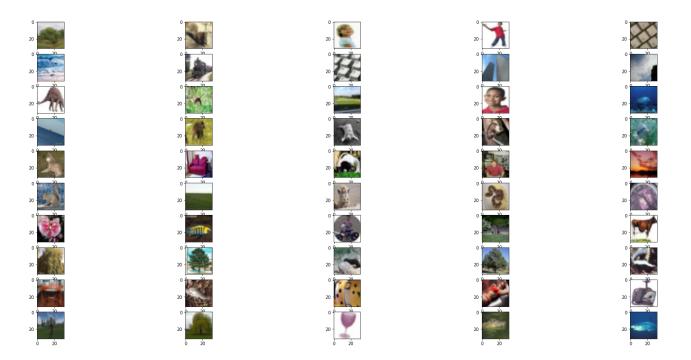

labels_dictionary =\ {0: 'apple', 1: 'aquarium_fish', 2: 'baby', 3: 'bear', 4: 'beaver', 5: 'bed', 6: 'bee', 7: 'beetle', 8: 'bicycle', 9: 'bottle', 10: 'bowl', 11: 'boy', 12: 'bridge', 13: 'bus', 14: 'butterfly', 15: 'camel', 16: 'can', 17: 'castle', 18: 'caterpillar', 19: 'cattle', 20: 'chair', 21: 'chimpanzee', 22: 'clock', 23: 'cloud', 24: 'cockroach', 25: 'couch', 26: 'crab', 27: 'crocodile', 28: 'cup', 29: 'dinosaur', 30: 'dolphin', 31: 'elephant', 32: 'flatfish', 33: 'forest', 34: 'fox', 35: 'girl', 36: 'hamster', 37: 'house', 38: 'kangaroo', 39: 'computer_keyboard', 40: 'lamp', 41: 'lawn_mower', 42: 'leopard', 43: 'lion', 44: 'lizard', 45: 'lobster', 46: 'man', 47: 'maple_tree', 48: 'motorcycle', 49: 'mountain', 50: 'mouse', 51: 'mushroom', 52: 'oak_tree', 53: 'orange', 54: 'orchid', 55: 'otter', 56: 'palm_tree', 57: 'pear', 58: 'pickup_truck', 59: 'pine_tree', 60: 'plain', 61: 'plate', 62: 'poppy', 63: 'porcupine', 64: 'possum', 65: 'rabbit', 66: 'raccoon', 67: 'ray', 68: 'road', 69: 'rocket', 70: 'rose', 71: 'sea', 72: 'seal', 73: 'shark', 74: 'shrew', 75: 'skunk', 76: 'skyscraper', 77: 'snail', 78: 'snake', 79: 'spider', 80: 'squirrel', 81: 'streetcar', 82: 'sunflower', 83: 'sweet_pepper', 84: 'table', 85: 'tank', 86: 'telephone', 87: 'television', 88: 'tiger', 89: 'tractor', 90: 'train', 91: 'trout', 92: 'tulip', 93: 'turtle', 94: 'wardrobe', 95: 'whale', 96: 'willow_tree', 97: 'wolf', 98: 'woman', 99: 'worm'}

Every 1.000th image of Traing set

```
In [87]:
    images_to_show = []
    for i, image in enumerate(X_train):
        if (i + 1) % 1000 == 0:
            images_to_show.append(i)

In [88]:

plt.figure(figsize=(30,15))
    columns = 5
    for i, image in enumerate(X_train[images_to_show]):
        plt.subplot(len(images_to_show) / columns + 1, columns, i + 1)
        plt.imshow(image)
```

3 Brief summary of data exploration and actions taken for data cleaning or feature engineering.

The data set provided did not needed any actions related to data cleaning.

In case of "feature engindeering" some action were taken known as Image Augmentation.

Basically Image Augmentation provides solutions to increase the size of training set (provides new sample of images) due to simple changes in atributes of images.

The simplest examples of Image Augmentation are:

- vertical copies of images
- shifts in orientation of images
- · rotations of images by some degrees

4 Summary of training at least three variations of the Deep Learning model you selected. For example, you can use different clustering techniques or different hyperparameters.

Model 1 scored: 0.4682
 Model 2 scored: 0.6203

• Model 3 scored: 0.6763

Confusion matrix

```
In [92]: #labels = ['Airplane', 'Automobile', 'Bird', 'Cat', 'Deer', 'Dog', 'Frog', 'Horse', 'Sh

# Convert predictions classes to one hot vectors
y_pred_classes = np.argmax(pred, axis=1)
# Convert validation observations to one hot vectors
```

Examples of correct classifications from Model 3.:

Examples of misclassifications from Model 3.:

5 A paragraph explaining which of your Deep Learning models you recommend as a final model that best fits your needs in terms of accuracy or explainability.

Due to characteristics of the problem I value accuracy more than explainability.

The model I recommend as a final one is the model with highest accuracy on a validation data set.

Model 3. with some Image Augmentation methods proved to be the best one.

6 Summary Key Findings and Insights, which walks your reader through the main findings of your modeling exercise.

All train models were trained on more-less similar initial architecture. Nonetheless they were slightly diffrent in few aspects.

- Model 1 was trained without Pooling.
 - in a comparison to Model 2 significant drop of accuracy was noted
 - removing Pooling increased significantly overall time needed for processing of each Epoch
- Model 2 was trained with same architecture as Model 1 but with an addition of Pooling
 - adding Pooling lowered time needed for processing of each Epoch
 - the accuracy increased from 0.47920 to 0.62780
- Model 3 was trained with same architecture as Model 2 but with an addition of Image Augmentation
 - the accuracy increased from 0.62780 to 0.67630

7 Suggestions for next steps in analyzing this data, which may include suggesting revisiting this model or adding specific data features to achieve a better model.

- There is still a space for more experiments and exploration with available Image Augmentation methods.
- Moving from Keras which is indeed high level library to more sophisticated one like TensorFlow might prove beneficial as well.

You can run my notebook on Kaggle. GPU recommended:
